

1. Based on the reports we discussed in class one of my classmates raised discussed about the app UberEATS in which there are many options like restaurants, groceries, drinks, rides, etc., which are displayed on home page and we have a search option to search the items. There is only option for search there is no option for voice as few people are may not be aware of options like searching and home page selection ,so users may face difficulties in finding the required Food, groceries, drinks etc. In order to eliminate the difficulties faced by the users I propose some solutions

- Firstly, we should make the filter options for items separately in the options so that users can select the options without voice option so that app will be more convenient to the users so that users can easily identify the options that are available in the app.
- Secondly, all users can't use the options on filters for Food, groceries, drinks, rides, etc., separately in the app so we should enable the option voice so that the users can easily order their needs.
- As per the changes made in the filter for the items should be shown under each option separately so that users can access the app easily.

- And also, there should be advertisements and video guide for the app explaining the features about the app and its options.
- Finally, we should add option for communication and voice massaging option in the app so that will be easily accessible to users.

2) There will always be a conflict between the user and developer on the respective app where I have some suggestions.

- People who have chosen the option for paid plans there should not be more ads before few days of expiration of plan and after expiration of the paid plan the ads shouldn't disturb them for a few days so that people can opt for app and it also lead to a loyal customer base.
- The app should be designed with less advertisements where the users won't get rid off from the app so that the developer can also maintain huge customer base for the app.
- Developer should provide offer for paid plans, free usage of app for six months rather than one month so that users will show interest to download the app .
- Developers can get more revenue by offering offers to the users.

3. The app called Send Anywhere is a app to share the documents,videos,images,etc., there is no limit of size for files can be used in all devices like Mobile phones,laptops .The app is free for all users and easily accessible by all the users. These platform is designed such that there is no limit for size and any files can be shared using this app. For an illustrator or someone with a design background, the app has a lot of elements that make it really appealing-especially the unique set of emotions, which makes it stand out in comparison to its competitors. These app is designed there is no distance limit we can share the files from any location without the limit of size . It is accessible by the users easily all options are displayed and also there will be help option provided in the settings .Overall, this is definitely a useful app, it captured my interest by providing special features compare to others.

4. I would like to create an app with features like where there will be options for messaging, voice messaging , meetings, class schedules, to do lists, homework, blackboard, mails in the app we create. By creating this app it would help students professors access there work easily without having different platforms for every work. If we have any doubts in the work instead of posting in the discussion platform or mail directly we can send a message to the professor or the team members quickly in this app, by checking the team members who completed the work or by seeing the resume of the members who can provide the answers quickly . The mobile app that I want to create helps people plan their schedules for their meetings, day plans, immediate changes updates for team or family members. I also want the app to provides you with alternative options to reschedule the tasks or meetings to take you around the difficult situations and get to your works as per the plans made by your own schedule. I want to complete the project with special features and also provide with more advantages for the users and make the

app user friendly.
